Hearing Care Partner VoC: Q3 2026 Readout

Headline

Clinics gave us an NPS of **+27**. 180 clinics answered the survey. **About 1 in 6 clinics are unhappy** (detractors). The main reason is that **repairs take too long**. Making repairs faster is the best way to raise the score.

Key findings

We found three main things. Each one is backed by both the survey and the operations data.

#	What we found	The numbers
1	**Slow repairs are the biggest reason clinics are unhappy**	Unhappy clinics wait 13.9 days for repairs. Happy clinics wait 8.9 days. Of everything we measured, repair time is the most linked to NPS.
2	**Clinics say the same thing in the survey**	Repairs is the hardest thing to deal with: 14.9% of clinics said it was difficult. That is the highest of all five areas. Ordering is second at 10.4%.
3	**The West region has the most unhappy clinics**	NPS in the West is +11. In the Northeast it is +43. West clinics also wait longer for repairs.

Unhappy clinics' comments say the same: repairs came up most (7 of 18 comments), followed by orders (6) and support (5).

What's working

Sales rep visits work very well. 96% of clinics said they were easy, and no clinic said they were difficult. Happy clinics also praised their reps, the training and the product. We should keep this strength as it is.

Recommendations

1. **Make repairs faster, starting in the West.** Work with Operations and Quality to find where repairs get stuck. Aim for about 9 days, which is what happy clinics get today. Try it first in the West, where the problem is biggest.
2. **Call back the 18 unhappy clinics who said we can contact them.** Reach each one within 48 hours, Gold accounts first. Follow the steps below. Write down what each clinic says, so the next survey can show if the call helped.
3. **Fix order delays next.** Clinics with more late orders give lower scores. Clear order status and backorder updates are a cheaper fix we can test at the same time.

Closed-loop playbook

Every unhappy clinic that agrees to be contacted gets a call from a real person within 48 hours. Then we check that the problem was fixed.

When	What happens	Who does it
Within 24 hours	**Flag it.** A score of 0–6 plus "Yes, you can contact me" puts the clinic on the Action List. Gold accounts go first, then the lowest scores.	CX Analyst
Within 24 hours	**Get ready.** Look up the clinic's repair times, late orders and support tickets. Then the caller knows the likely problem, even if the clinic left no comment.	CX Analyst
Within 48 hours	**Call.** The sales rep or a Customer Excellence lead calls the clinic. Listen, confirm the real problem, and agree on one clear next step.	Sales rep or Customer Excellence
Within 1 week	**Send it to the right team.** Record the problem type (repairs, orders, support, other) and pass it to Operations, Quality or Support.	Customer Excellence
Within 2 weeks	**Check back.** Make sure the next step actually happened.	Whoever made the call

When	What happens	Who does it
Next survey	**Measure.** Compare scores of clinics we called with clinics we didn't. Share the problem counts with each team.	CX Analyst

This quarter: 18 clinics are on the list, including 3 Gold accounts. Start with CL0127. It is a Gold account with a score of 2 and repairs averaging 22.7 days. It left no comment, but the repair data shows the likely problem.

Limitations

- **Linked is not the same as caused.** Slow repairs and low scores go together, but we need proof. If repairs get faster and scores go up next quarter, that is the proof.
- **Few comments.** Only 18 unhappy clinics left comments. That is too few to rank the complaints with confidence. The repair data and ease scores are the stronger evidence.
- **Only one survey so far.** This is one quarter. We need at least two more surveys to see trends.
- **Not everyone answered.** 120 of 300 clinics did not reply. Each quarter, we should check that they look similar to the clinics that did.

About this project

This is a personal practice project. It is not connected to any hearing aid company. All survey answers and operations data are **made up (synthetic)**. I created them in Python with known patterns, to test that my analysis could find them.

- **Survey:** built in Qualtrics. It measures NPS, satisfaction (CSAT) and ease (NES), shows each clinic only the questions that apply to them, and links each answer to the clinic's account.
- **Analysis:** Python (pandas), joining survey answers with clinic operations data.
- **Dashboard:** Power BI, three pages: Overview, Drivers, Action List.
